

# Monte Carlo localisation using particle filter

Michal CHOVAŇEC

*Januray 2018*

# Problem formulation

## Robot localisation on known map

- map,  $\hat{o} = m(\hat{x}, \hat{y}) = m(\hat{r})$
- position change,  $dr = (dx, dy) + noise$
- observation,  $o(x, y) = o(r)$

# Particle filter - initialization

Generate tons of random hypothesis -> particles

Particle : **position** + **weight**

# Particle filter - algorithm

**Data:**  $map$ ,  $dr$ ,  $observation$

**Result:** position  $R$

initialization

$P_r$  = random particles positions

$P_w$  = only first time init particles weights to zero

$R = 0$

MoveParticles( $P_r$ ,  $dr$ )

$P_w$  = ComputeWeights( $observation$ ,  $map(P_r)$ ,  $P_w$ )

$P_w$  = NormaliseWeights( $P_w$ )

**for**  $i$  from 0 to  $particles\_count$  **do**

$R = R + P_w(i)P_r(i)$

**end**

$P_r$  = Resample( $P_w$ ,  $P_r$ )

# Complexity analysis - naive implementation

**Data:**  $\text{map}$ ,  $\text{dr}$ ,  $\text{observation}$

**Result:** position  $R$

initialization

$P_r$  = random particles positions

$P_w$  = only first time init particles weights to zero

$R = 0$

MoveParticles( $P_r$ ,  $\text{dr}$ ) //  $O(N)$

$P_w$  = ComputeWeights( $\text{observation}$ ,  $\text{map}(P_r)$ ,  $P_w$ ) //  $O(NM)$

$P_w$  = NormaliseWeights( $P_w$ ) //  $O(N)$

//  $O(N)$

**for**  $i$  from 0 to  $\text{particles\_count}$  **do**

$R = R + P_w(i)P_r(i)$

**end**

$P_r$  = Resample( $P_w$ ,  $P_r$ ) //  $O(N^2)$

$\text{total} = O(3N + NM + N^2)$

# Complexity analysis - optimal? implementation

**Data:**  $\text{map}$ ,  $\text{dr}$ ,  $\text{observation}$

**Result:** position  $R$

initialization

$P_r$  = random particles positions

$P_w$  = only first time init particles weights to zero

$R = 0$

MoveParticles( $P_r$ ,  $\text{dr}$ ) //  $O(N)$

$P_w$  = ComputeWeights( $\text{observation}$ ,  $\text{map}(P_r)$ ,  $P_w$ )  
//  $O(N \log_2(M))$

$P_w$  = NormaliseWeights( $P_w$ ) //  $O(N)$   
//  $O(N)$

**for**  $i$  from 0 to  $\text{particles\_count}$  **do**

$R = R + P_w(i)P_r(i)$

**end**

$P_r$  = Resample( $P_w$ ,  $P_r$ ) //  $O(N \log_2(N))$

$\text{total} = O(3N + N \log_2(M) + N \log_2(N))$
